What Are PFOA and PFOS?
Perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) are chemicals that are prevalent in the environment and were once commonly used in many consumer products. They are part of a larger group referred to as per-and polyfluoroalkyl substances (PFAS). Although PFOA and PFOS are no longer manufactured in the United States, other countries still make products that contain these chemicals, which may be imported into the United States. [Note: other PFAS are still made and used in the US.]

What Are Ways People Are Exposed to PFOA and PFOS?
Water is just one of many ways that people come in contact with these substances. These chemicals are resistant to heat, water and oil and have been used for decades in hundreds of industrial applications and consumer products. PFAS have been found both in the environment and in blood samples of the general U.S. population. The U.S. Food and Drug Administration has also detected PFAS chemicals in the U.S. food supply.

Due to the prolonged use of PFOA and PFOS in many common consumer products, the chemicals have been known to enter the water cycle through conventionally treated wastewater discharges from sewage treatment facilities, and locations where the substances were used outdoors. Most people have been exposed to these chemicals through consumer products, but drinking water can be an additional source of exposure in communities where these chemicals have entered water supplies.
When Did OCWD First Detect PFOA and PFOS in the Groundwater?
From 2013-2015, the Orange County Water District (OCWD) performed testing for the local Orange County water retailers it serves as part of the Environmental Protection Agency (EPA) Third Unregulated Contaminant Monitoring Rule (UCMR3). The results of this testing were provided to the EPA, the State Water Resources Control Board (SWRCB) Division of Drinking Water (DDW) and individually to the 19 water retailers OCWD serves. The UCMR data serves as a primary source of occurrence and exposure information that EPA uses to develop regulations.

What is the EPA Doing About PFOA and PFOS?
In 2009, EPA published provisional health advisories for PFOA and PFOS. As science and technology advanced, in May 2016, it replaced the provisional advisories with a lifetime health advisory, including the most sensitive populations, of a combined 70 parts per trillion (ppt). Based on preliminary information from EPA, 63 water suppliers in the United States detected PFOA and PFOS in their drinking water supplies. Twenty-six of these water systems are located in California. EPA's health advisories are non-enforceable and non-regulatory and provide technical information to states' agencies and other public health officials on health effects, analytical methodologies and treatment technologies associated with drinking water contamination. EPA is moving forward with the enforceable Maximum Contaminant Level (MCL) process for PFOA and PFOS. It is also gathering and evaluating information to determine if regulation is appropriate for a broader class of PFAS. While EPA is responsible for the safety of drinking water, the FDA regulates bottled drinking water. EPA standards are more stringent regarding the regulation of public drinking water.

What is California Doing About PFOA and PFOS?
In July 2018, DDW established interim drinking water Notification and Response Levels for PFOA and PFOS. Results above the Notification Level require agencies to notify the governing body for the areas where the water has been served within 30 days of receiving the verifying test results. If the Response Level is exceeded in drinking water provided to consumers, DDW recommends that the water agency remove the water source from service or provide treatment.

In April 2019, DDW sent monitoring orders to more than 200 public water systems across the state to test for PFOA and PFOS, including 12 in OCWD’s service area. The comprehensive list of monitoring orders included 612 drinking water supply wells in California; of which 53 were in OCWD’s service area. Wells were selected on the basis of proximity to either landfills, municipal airports or past detections of PFAS in wells. The data provided by this testing will help DDW determine standards for PFOA and PFOS in drinking water.

In August 2019, DDW announced a new Notification Level for PFOA and PFOS, 5.1 ppt and 6.5 ppt, respectively. In February 2020, DDW announced a new Response Level of 10 ppt for PFOA and 40 ppt for PFOS.

### CA DDW Notification Levels (NL)*

<table>
<thead>
<tr>
<th>Compound</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFOA</td>
<td>5.1 ppt-per-trillion (ppt)</td>
</tr>
<tr>
<td>PFOS</td>
<td>6.5 ppt-per-trillion (ppt)</td>
</tr>
</tbody>
</table>

### CA DDW Response Levels (RL)*

<table>
<thead>
<tr>
<th>Compound</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>PFOA</td>
<td>10 parts-per-trillion (ppt)</td>
</tr>
<tr>
<td>PFOS</td>
<td>40 parts-per-trillion (ppt)</td>
</tr>
</tbody>
</table>

A “part-per-trillion” is the equivalent of one drop of water in 20 Olympic-sized swimming pools.
What is OCWD Doing About PFOA and PFOS?
We take seriously our duty to provide reliable high-quality drinking water meeting all state and federal standards to cities throughout Orange County. OCWD’s Philip L. Anthony Water Quality Laboratory was the first public agency laboratory in California to achieve state certification to analyze for PFAS in drinking water. OCWD invested more than $1 million in equipment to support the lab in performing this analysis. To further support this issue, OCWD is doing the following:

- Conduct the nation's largest pilot program to test methods for removing PFAS from water supplies, along with a planning study to help retailers evaluate how treatment could be quickly implemented.
- Assist water retailers it serves in compliance with DDW notification and testing requirements.
- Work with the Regional Water Quality Control Board regulators and the Santa Ana Watershed Project Authority to identify potential sources of PFAS.
- Obtain laboratory certification to test for more PFAS compounds.
- Monitor to determine extent of compounds in the groundwater basin and in recharge water supplies.
- Stay current with changing technology for both detection and treatment.
- Be transparent and communicate regularly with stakeholders.

OCWD and Retail Agencies in Orange County are Committed to Public Health and Safety
OCWD and the water retailers it serves provide some of the cleanest drinking water in the world. OCWD is committed to ensuring that the community is knowledgeable and has the resources available to understand local water quality. To help achieve this, OCWD remains proactive in water quality investigation and ensures that all test results are publicly available. In addition, comprehensive water quality data files are provided annually to the cities and districts it serves. OCWD tests water from about 1,500 locations throughout the Orange County Groundwater Basin, taking more than 20,000 samples and conducting 400,000 analyses of these samples each year.

All water agencies in OCWD’s service area operate their water systems following all drinking water requirements for PFOA and PFOS established by EPA and DDW. To meet the state's recommended PFAS levels, water providers are taking actions such as:

- Removal of water supply sources from service. To date, more than 40 wells have been taken out of service.
- Use of imported water that meets the state's recommended levels of PFAS.
- Blending multiple water supply sources to meet the state's recommended levels of PFAS.
- Pilot testing of water treatment processes for PFAS.

### Estimated Costs of PFAS to Orange County over 30 Years

<table>
<thead>
<tr>
<th>Cost Item</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capital Cost of Treatment</td>
<td>$250 Million</td>
</tr>
<tr>
<td>O&amp;M Cost</td>
<td>$500 Million</td>
</tr>
<tr>
<td>Additional Imported Supplies</td>
<td>$168 Million</td>
</tr>
<tr>
<td>Additional Costs</td>
<td>TBD</td>
</tr>
</tbody>
</table>

*Total Estimated Cost $1 Billion
What Are PFOA and PFOS?
